SEROLOGY & IMMUNOLOGY

TEST	VALUE	UNIT	REFERENCE
HIV (Card Test)			
HIV - 1	NEGATIVE		
HIV - 2	NEGATIVE		

1. A negative result implies that no Anti HIV – 1 & HIV - 2 antibodies have been detected in the sample by this method. This means that either the patient has not been exposed to HIV-1 or HIV-2 infection or the sample has been tested during the "WINDOW PHASE" (before the development of detectable levels of antibodies).
2. A positive result suggests the possibilities of HIV-I and / or HIV-II infection. However these results must be verified by a confirmatory test (IFA / WESTERN BLOT I-II) before pronouncing the patient positive for HIV-1 and / or HIV-2 infection.

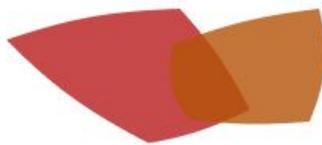

Hepatitis C Virus, HCV	NEGATIVE
HBsAg	NEGATIVE

A Negative result does not preclude the possibility of infection with HBV. Other clinically available tests are required if questionable result are obtained. As with all diagnostic tests, a definitive clinical diagnosis should not be based on the result of single test, but should only be made by the physician after all clinical and laboratory findings have been evaluated.
